

# LM3447: Performance Analysis (43 EVM Production Samples)

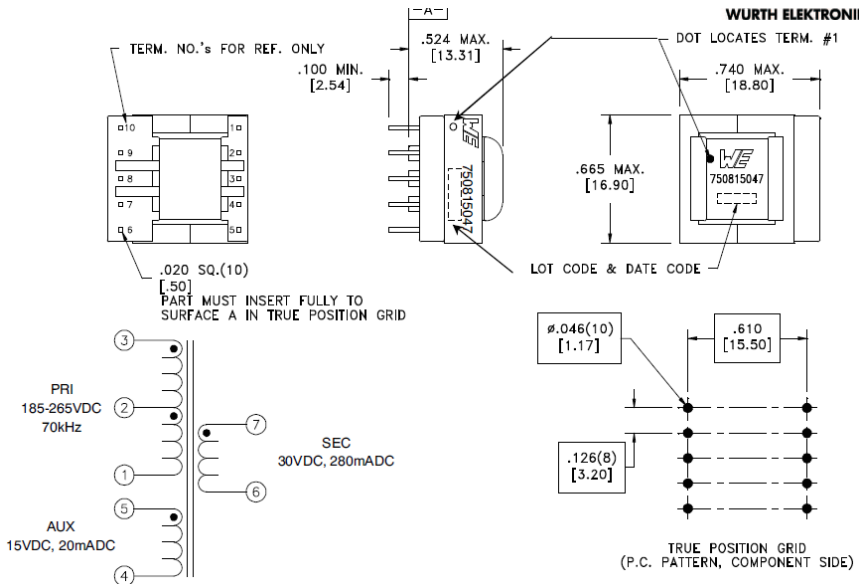

**Lighting Power Products  
Longmont Design Center**

# Design Example: LM3447-A19-230VEVM

(Online: <http://www.ti.com/tool/lm3447-a19-230vevm>)

	Typ	Units
Input Voltage	230	$V_{RMS}$
Output Voltage	30	V
LED Current	275	mA
Output Power	8.25	W
Input Power	10.1	W
Efficiency	82	%
Power Factor	0.95	

- EVM production lot = 150
  - Sampled size = 43
  - Random sampling
  - LM3447MT – Tape & Reel
  - Xfmr – 750815047
- Würth Electronics China

# Schematic: LM3447-A19-230VEVM

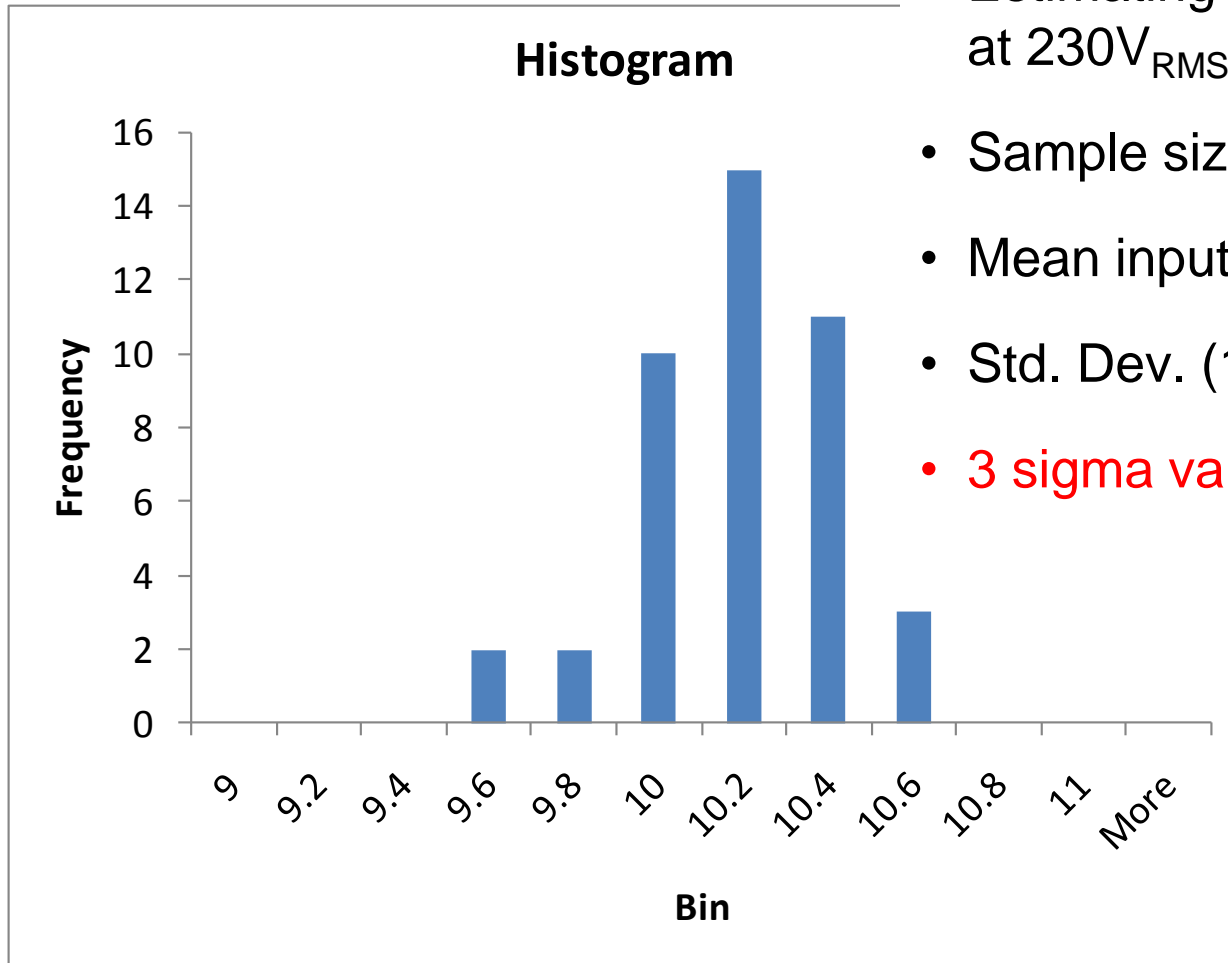

# LM3447: Theoretical Analysis (1)

$$P_{IN} = \frac{\pi}{4} \frac{G_{FF}^2 V_{REF}^2}{L_M f_S} \left( \frac{R_{AC}}{R_{FF}} \right)^2$$

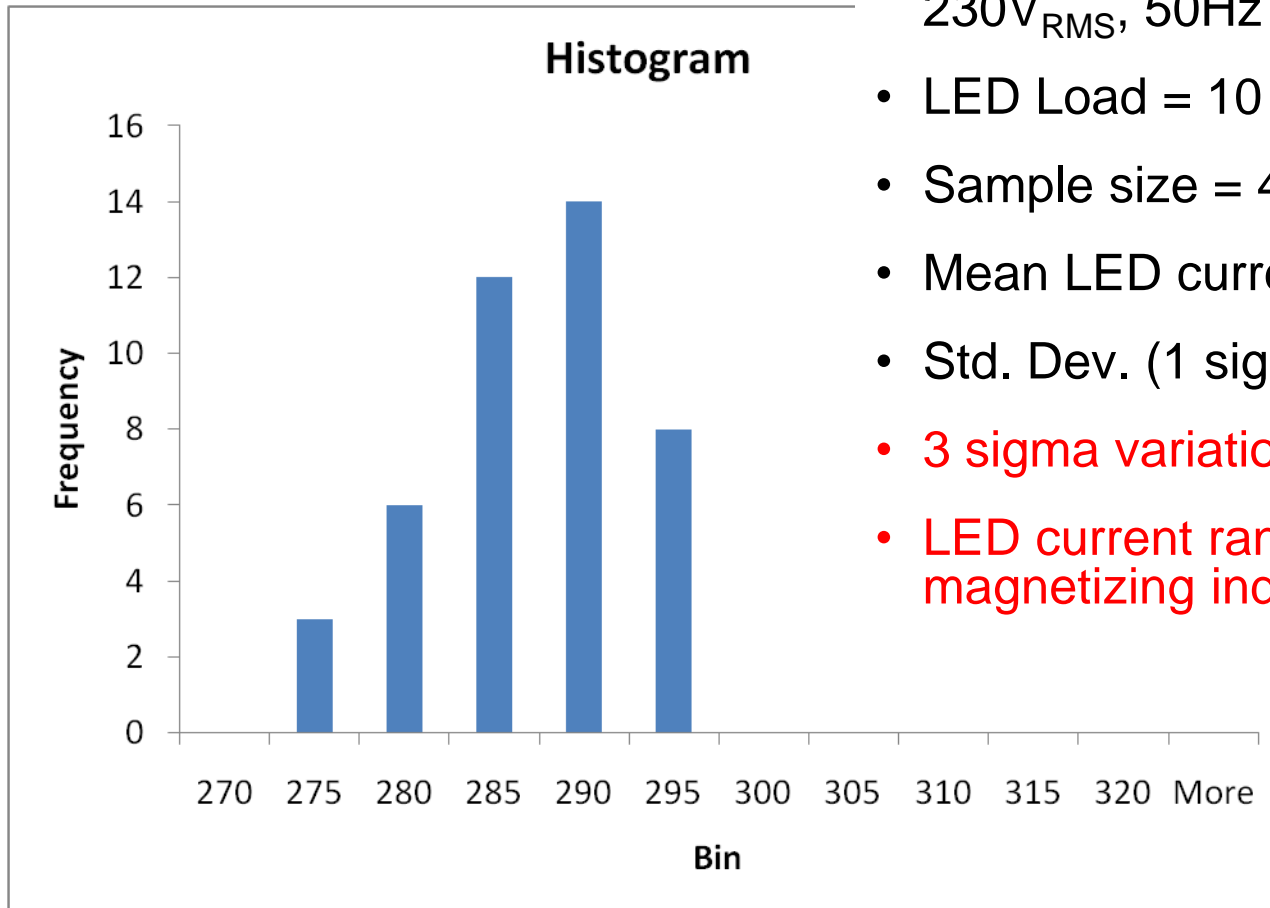

- $P_{IN}$  – Input power
- $L_M$  – Primary side magnetizing inductance
- $f_S$  – Switching frequency
- $G_{FF}$  – Internal gain
- $V_{REF}$  – Internal reference
- $R_{AC}$  – AC sense resistor (R4)
- $R_{FF}$  – Feedforward resistor (R13)
- Input power is function of external components
- Impact of magnetizing inductance:  $L_M$ 
  - Inversely proportionality
  - Manufacturing spec  $< \pm 10\%$
  - Based on air-gap tolerance (independent of Ferrite material)
- External resistors (ratio)
  - $R_{AC}$  &  $R_{FF}$  with  $\pm 1\%$  tolerance
- Internal IC parameters trimmed and tested to industry standards

# Input Power Variation (Production Run)

- Estimating board-to-board variations at  $230V_{RMS}$ , 50Hz operating point
- Sample size = 43 boards
- Mean input power = 10.1W
- Std. Dev. (1 sigma) = 221mW
- **3 sigma variation =  $\pm 6.6\%$**

# LED Current Variation

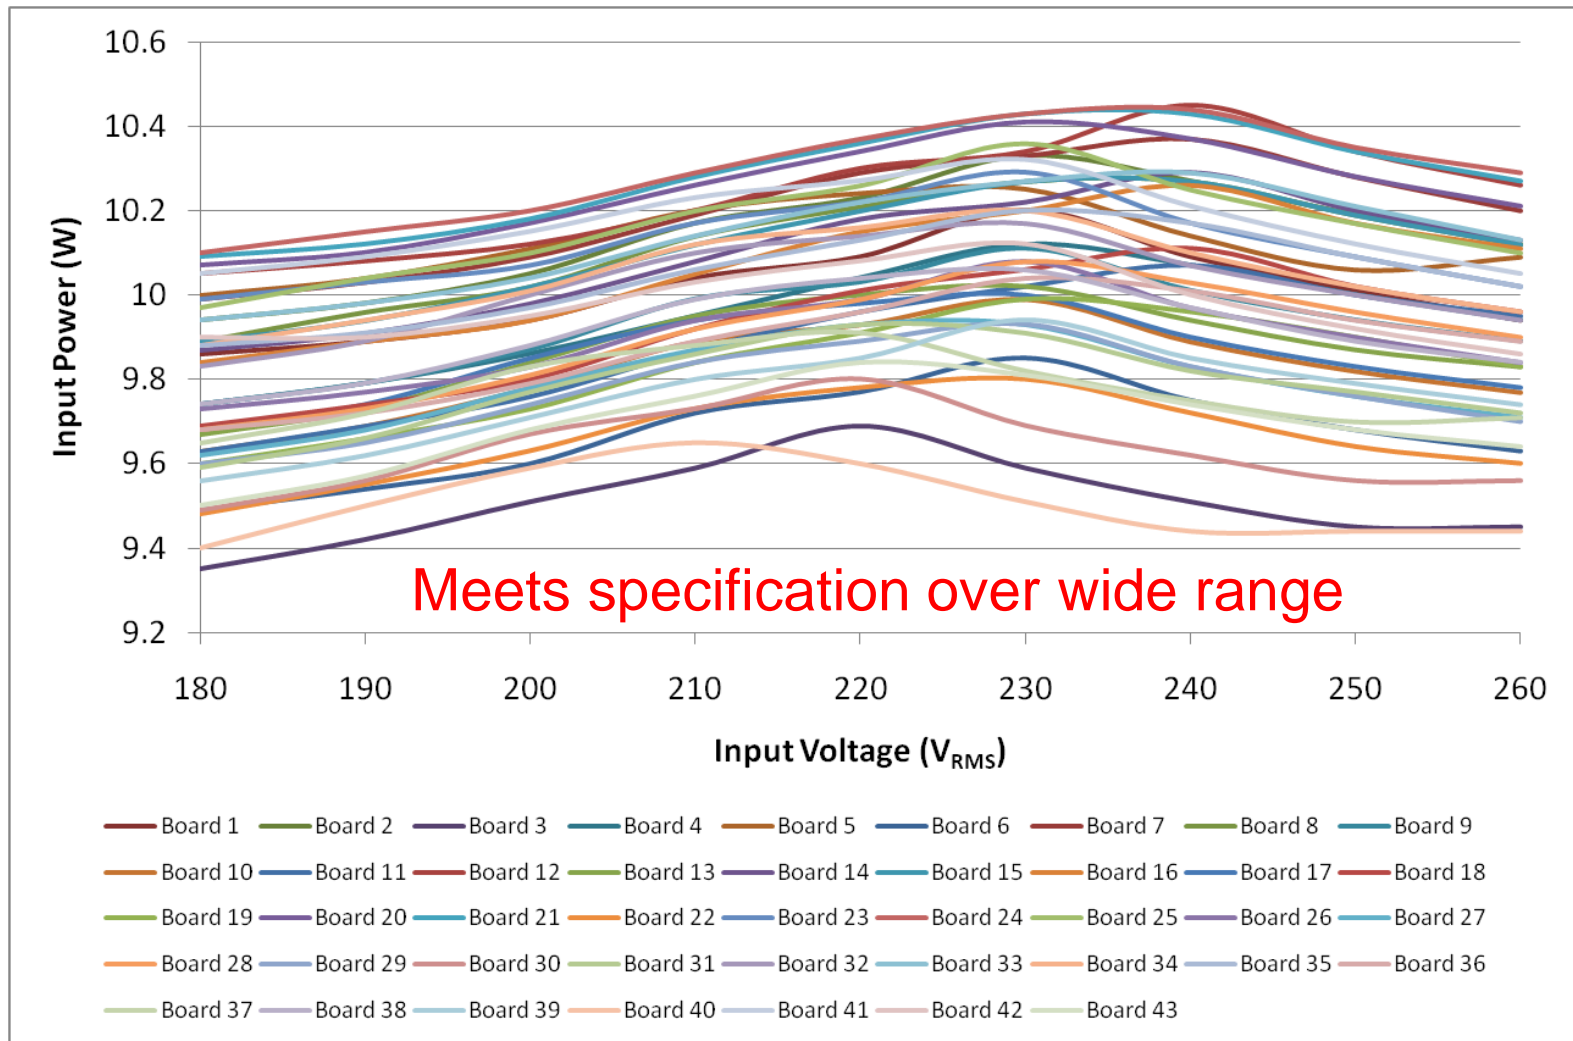

- Estimating board-to-board variations at  $230V_{RMS}$ , 50Hz operating point
- LED Load = 10 Rebel LEDs
- Sample size = 43 boards
- Mean LED current = 284mA
- Std. Dev. (1 sigma) = 5.86mA
- 3 sigma variation =  $\pm 6.19\%$
- LED current range depends on magnetizing inductance variation

# Input Power vs. Input Voltage (210V to 260V)

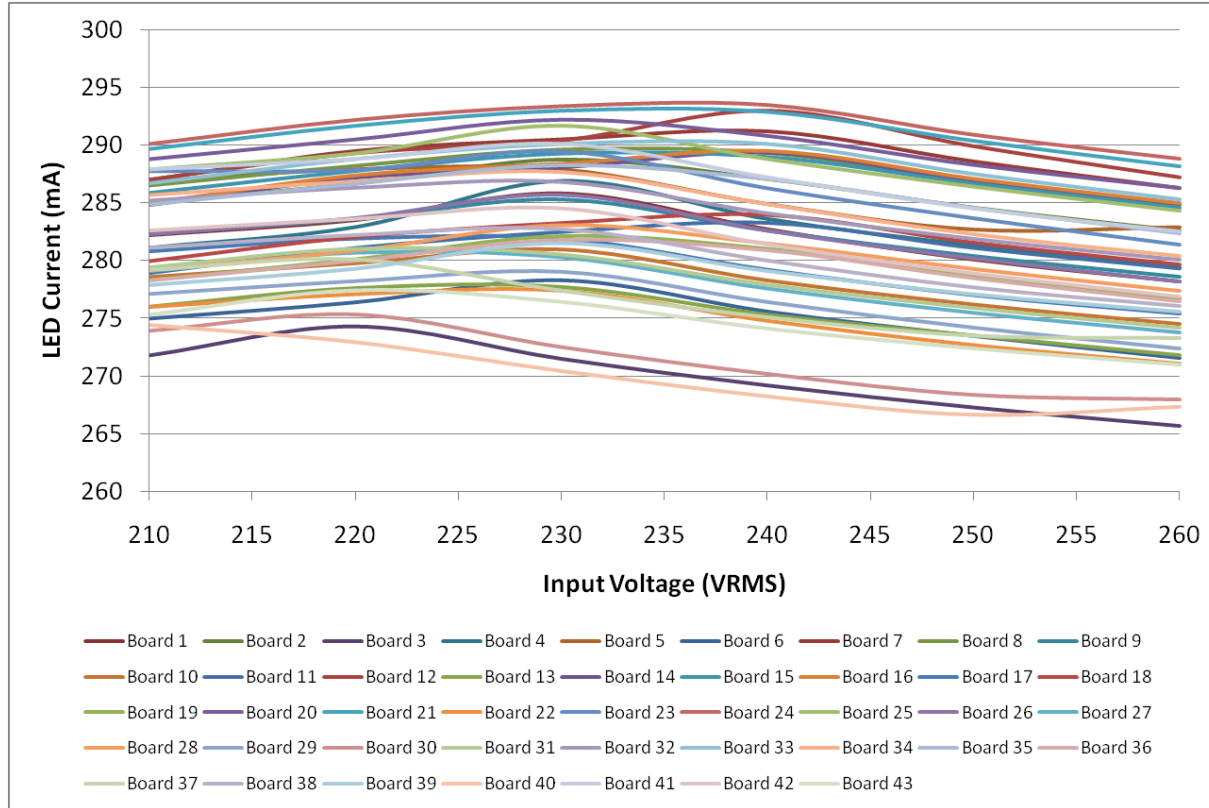

- Input power range for sample size of 43 boards (210V<sub>RMS</sub> to 260V<sub>RMS</sub>)
  - Min = 9.44W (-5.7%)
  - Max = 10.45W (+4.4%)
  - Average = 10.01W
- Input power deviation at any given voltage < ±7.5% (3 sigma)

# Input Power vs. Input Voltage: Extended Range (180V to 260V)

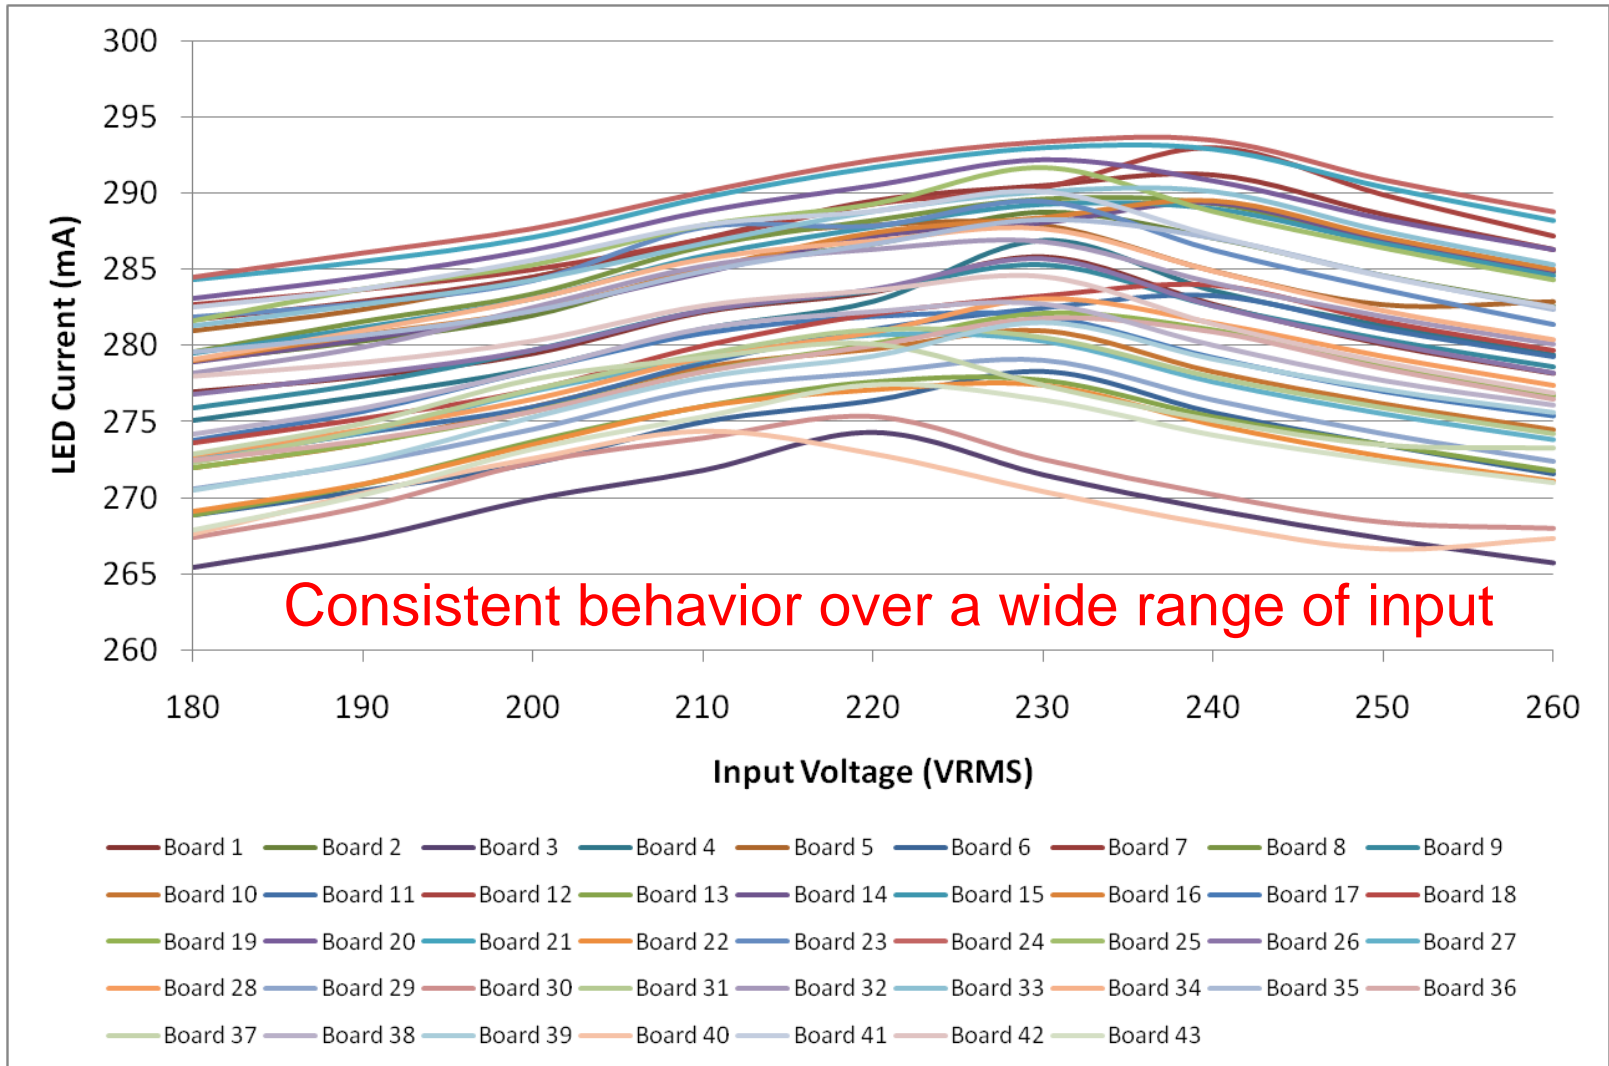

# LED Current vs. Input Voltage

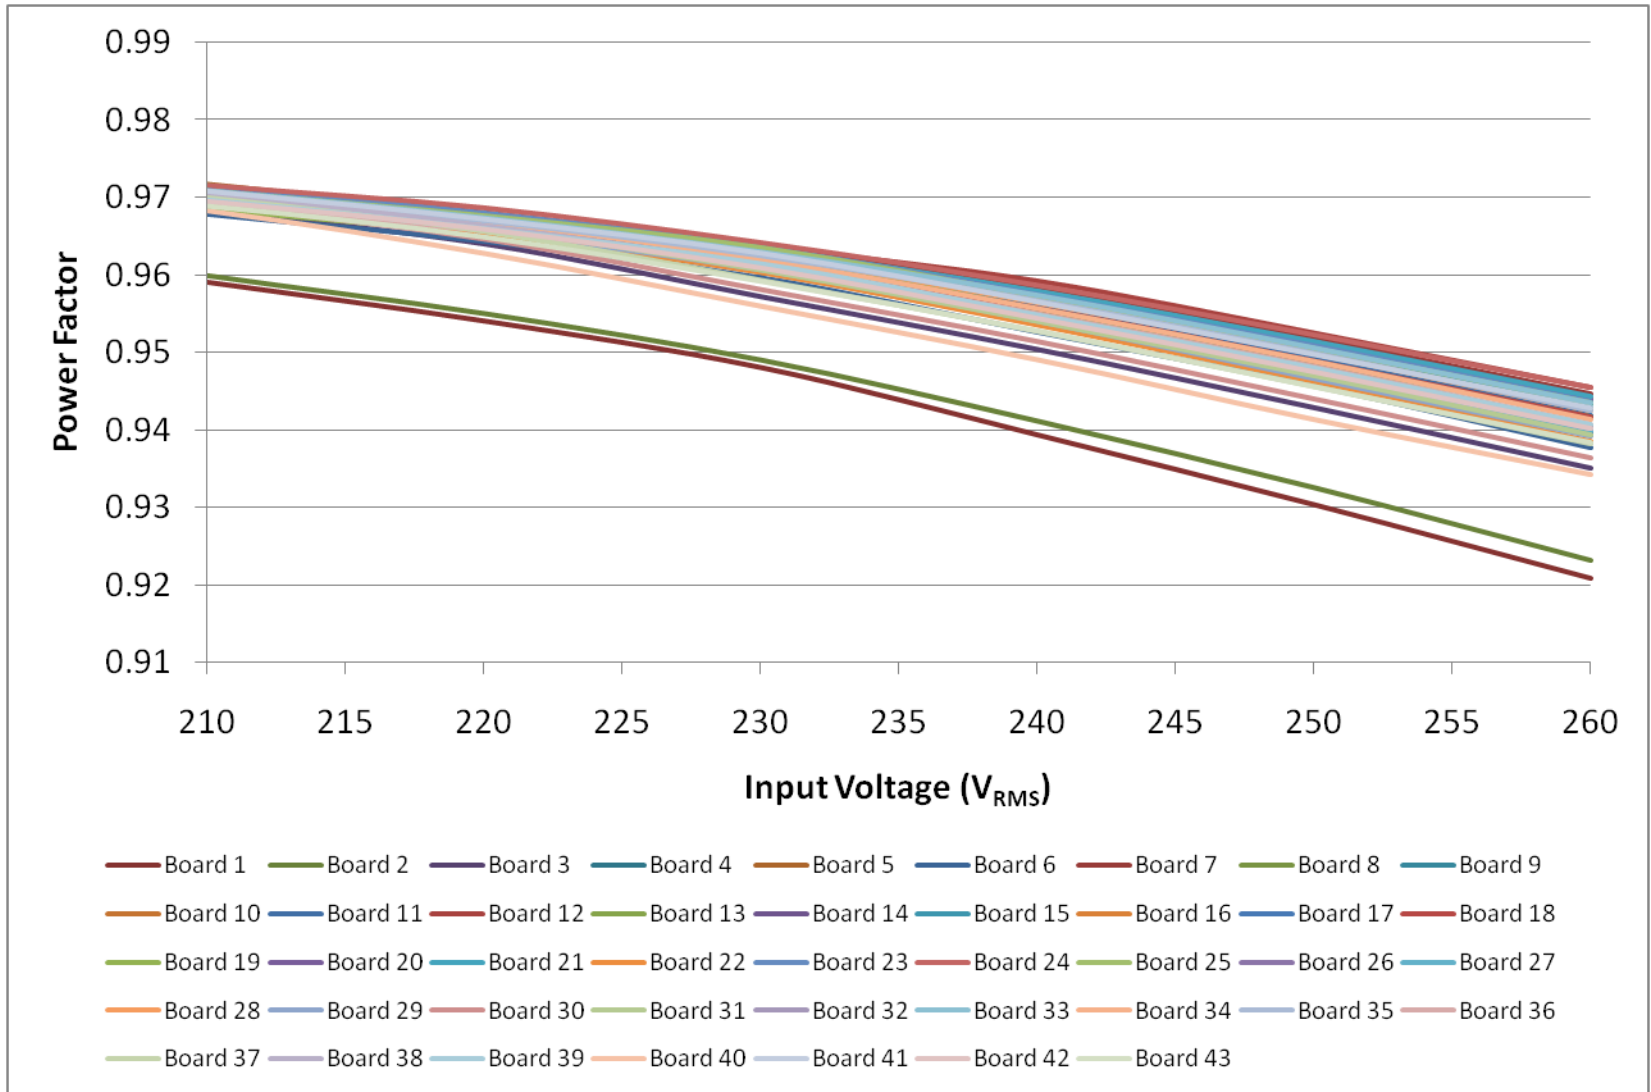

- LED current range for sample size of 43 boards (210V<sub>RMS</sub> to 260V<sub>RMS</sub>)
  - Min = 265.7mA(-5.74%)
  - Max = 293.5mA (+4.12%)
  - Average = 282mA
- LED current deviation at any given voltage < ±7% (3 sigma)

# LED Current vs. Input Voltage: Extended Range (180V to 260V)

# Power Factor vs. Input Voltage

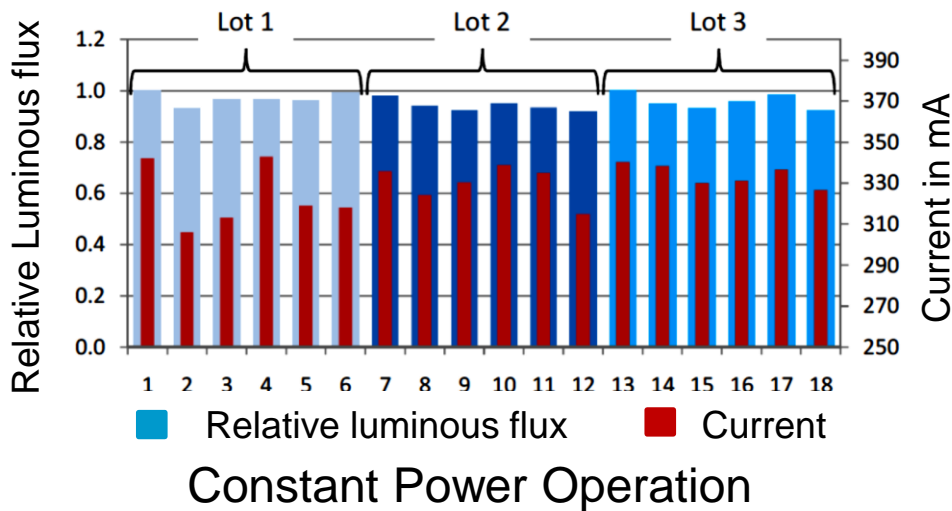

# Summary

- Input power and LED current dependent on
  - Magnetizing inductance ( $L_M$ )
  - External resistors ( $R_{AC}$ ,  $R_{FF}$ )
  - Internal IC parameters ( $G_{FF}$ ,  $V_{REF}$ ,  $f_S$ )\*
- Theoretical analysis can be performed based on mathematical relation derived DCM Flyback PFC converter
- Experimental analysis performed for LM3447-A19-230VEVM using a sample size of 43 boards and 10 series connected Luxeon Rebel LED load board
  - Input power variation at  $230V_{RMS}$ , 50Hz =  $\pm 6.6\%$  (3 sigma)
  - LED current variation at  $230V_{RMS}$ , 50Hz =  $\pm 6.19\%$  (3 sigma)
  - Input power variation at any voltage between 210-260V <  $\pm 7.5\%$  (3 sigma)
  - LED current variation at any voltage between 210-260V <  $\pm 7\%$  (3 sigma)
- Input power variation is within the desired specification over input range (3 sigma)
- LED current variation is close to the desired specification over input range (3 sigma)
- Expecting lower luminous flux variation over different LED bins, operating temperature and life time using power regulation approach
- Improved LED current matching can be achieved by reducing magnetizing inductance variation during manufacturing

TI Information – Selective Disclosure

# Discussion: Comparing Power Regulation with Current Regulation Control

- Measured experimental data for 18 CREE MC-E LEDs
- Constant current (350 mA) operation
  - Maximum luminous flux difference of 8.5%
- Constant power (4 W) operation
  - Maximum luminous flux difference of 6.7%
- Power regulation approach is suggested to be better than current regulation when considering LED manufacturing variations
